

A large, yellow hydraulic excavator arm is shown against a dark, cloudy sky. The arm is angled upwards and to the right, with various mechanical components like hoses and joints visible.

HARLEX

Hydraulic cylinder mill type

Series CDH2 / CGH2 / CSH2

Features

- Standards: ISO 24333, ISO 6022
- 6 types of mounting
- Piston Ø: (\varnothing_{AL}): 40 to 320 mm
- Piston rod Ø (\varnothing_{MM}): 25 to 220 mm
- Stroke lengths up to 6 m

Technical data (For applications outside these parameters, please consult us!)

Standards:

The installation dimensions and types of mounting of the cylinders comply with the standards DIN 24333 and ISO 6022.

Nominal pressure: 250 bar

Static test pressure: 375 bar

Reduced test pressure: 315 bar

Higher operating pressures upon request

The specified operating pressures apply to applications with shock-free operation with regard to excess pressure and/or external loads. With extreme loads like e.g. high cycle sequence, mounting elements and threaded piston rod connections must be designed for durability.

Minimum pressure:

Depending on the application, a certain minimum pressure is required in order to guarantee good functioning of the cylinder. Without load, a minimum pressure of 10 bar is recommended for differential cylinders; for lower pressures as well as double-acting cylinders, please contact us.

Installation position: Any

Hydraulic fluid:

Mineral oils DIN 51524 HL, HLP

Oil-in-water emulsion HFA

Water glycol HFC

Phosphate ester HFD-R

Polyol ester HFD-U

Hydraulic fluid temperature range: See page 66

Ambient temperature range: See page 66

Optimum viscosity range: 20 to 100 mm²/s

Minimum admissible viscosity: 12 mm²/s

Maximum admissible viscosity: 380 mm²/s

Cleanliness class according to ISO

Maximum admissible degree of contamination of the hydraulic fluid according to ISO 4406 (c) class 20/18/15.

The cleanliness classes specified for the components need to be met in hydraulic systems. Effective filtration prevents faults and at the same time increases the life cycle of the components.

Bleeding by default: Secured against screwing out

Primer coat: By default, hydraulic cylinders are primed with a coating (color gentian blue RAL 5010) of min. 40 µm. Other colors upon request.

With cylinders and attachment parts, the following surfaces are not primed or painted:

- All fit diameters to the customer side
- Sealing surfaces for line connection
- Sealing surfaces for flange connection
- Connection surfaces for valve mounting
- Inductive proximity switches
- Position measurement system

The surfaces that are not painted are protected by means of a corrosion protection agent (MULTICOR LF 80).

In the online order system, more painting systems can be selected. These systems are not displayed via the type key and not automatically considered when ordering replacement cylinders. Accessories that are ordered as separate order item are not primed or painted by default. Corresponding priming and/or painting on request.

Stroke velocity: Please observe the guideline on max. stroke velocities (with recommended flow velocity of 5 m/s in the line connection) in the table. Higher stroke velocities on request. If the extension velocity is considerably higher than the retraction velocity of the piston rod, drag-out losses of the medium may result. If necessary, please consult us.

Piston-Ø (mm)	Line connection	Max. stroke velocity in m/s
40	G1/2	0,31
50	G1/2	0,20
63	G3/4	0,28
80	G3/4	0,18
100	G1	0,20
125	G1	0,13
140	G1 1/4	0,16
160	G1 1/4	0,12
180	G1 1/4	0,10
200	G1 1/4	0,08
220	G1 1/2	0,09
250	G1 1/2	0,07
280	G1 1/2	0,06
320	G1 1/2	0,04

Technical data (For applications outside these parameters, please consult us!)

Boundary and application conditions:

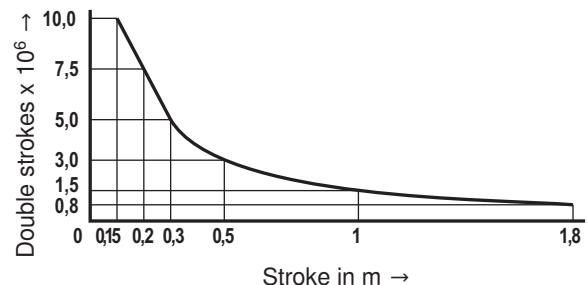

- The mechanical alignment of the movement axis and thus the mounting points of hydraulic cylinder and piston rod must be ensured. Lateral forces on the guides of piston rod and piston are to be avoided. It may be necessary to consider the own weight of the hydraulic cylinder (MP3/MP5 or MT4) or the piston rod.
- The buckling length/buckling load of the piston rod and/or the hydraulic cylinder must be observed (see page topic Buckling).
- The maximum admissible stroke velocities with regard to the suitability/load of seals must be observed as must their compatibility with the properties of the fluid type (see page topic Seals).
- The maximum admissible velocities/kinetic energies when moving into the end positions, also considering external loads, must be observed.
Danger: Excess pressure
- The maximum admissible operating pressure must be complied with in any operating state of the hydraulic cylinder. Possible pressure intensification resulting from the area ratio of annulus to piston area and possible throttling points are to be observed.
- Detrimental environmental influences, like e.g. aggressive finest particles, vapors, high temperatures, etc. as well as contaminations and deterioration of the hydraulic fluid are to be avoided.

Notice: This list does not claim to be complete. In case of questions regarding the compatibility with media or exceedance of the boundary or application conditions, please contact us.

Life cycle:

cylinders correspond to the reliability recommendations for industrial applications.

≥ 10000000 double strokes in idle continuous operation or 3000 km piston travel at 70 % of the maximum operating pressure, without load on the piston rod, with a maximum velocity of 0.5 m/s, with a failure rate of less than 5 %.

Acceptance:

Each cylinder is tested according to standard and in compliance with ISO 10100: 2001.

Safety instructions:

For the assembly, commissioning and maintenance of hydraulic cylinders, the operating instructions have to be observed!

Service and repair works have to be performed by personnel especially trained for this purpose. No warranty is accepted for damage as a consequence of assembly, maintenance or repair works not performed.

Check lists for hydraulic cylinders:

Cylinders the characteristics and/or application parameters of which deviate from the values specified in the data sheet can only be offered as special version upon request. For offers, the deviations of the characteristics and/or application parameters must be described in the check lists for hydraulic cylinders.

Project planning software ICS (Interactive Catalog System)

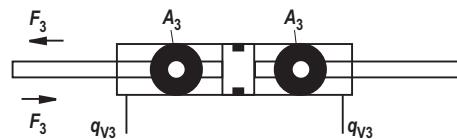

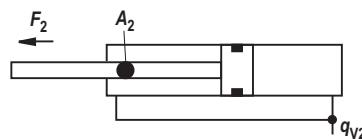

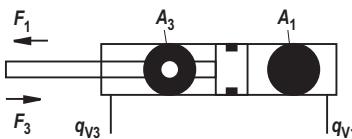

The ICS (Interactive Catalog System) is a selection and project planning help for hydraulic cylinders. The ICS allows designers for machines and systems to quickly and reliably find the perfect hydraulic cylinder solution through logic-guided type key enquiries. This software helps to solve design and project planning tasks more quickly and efficiently. After having been guided through the product selection, the user

quickly and reliably gets the exact technical data of the selected components as well as 2D and 3D CAD data in the correct file format for all common CAD systems.

This allows users to reduce costs while increasing their competitiveness.

ØAL = Piston Ø

ØMM = Piston rod Ø

X* = Stroke length

1) Bleeding: With view to the piston rod, the position is offset by 90° in relation to the line connection (clockwise)

2) Ø D4 max. 0,5 mm deep

3) Thread size does not correspond to ISO 6022; M50 x 2 available upon request

4) Flange connections see separate table pages 36 and 37

5) Throttle valve only with end position cushioning "E" (180° for bleeding)

6) Piston Ø not standardized

7) Dimensions for cylinders with seal design M, T, G, L, R, S and V

8) Dimensions for cylinders with seal design A and B

10) Standard design "W"
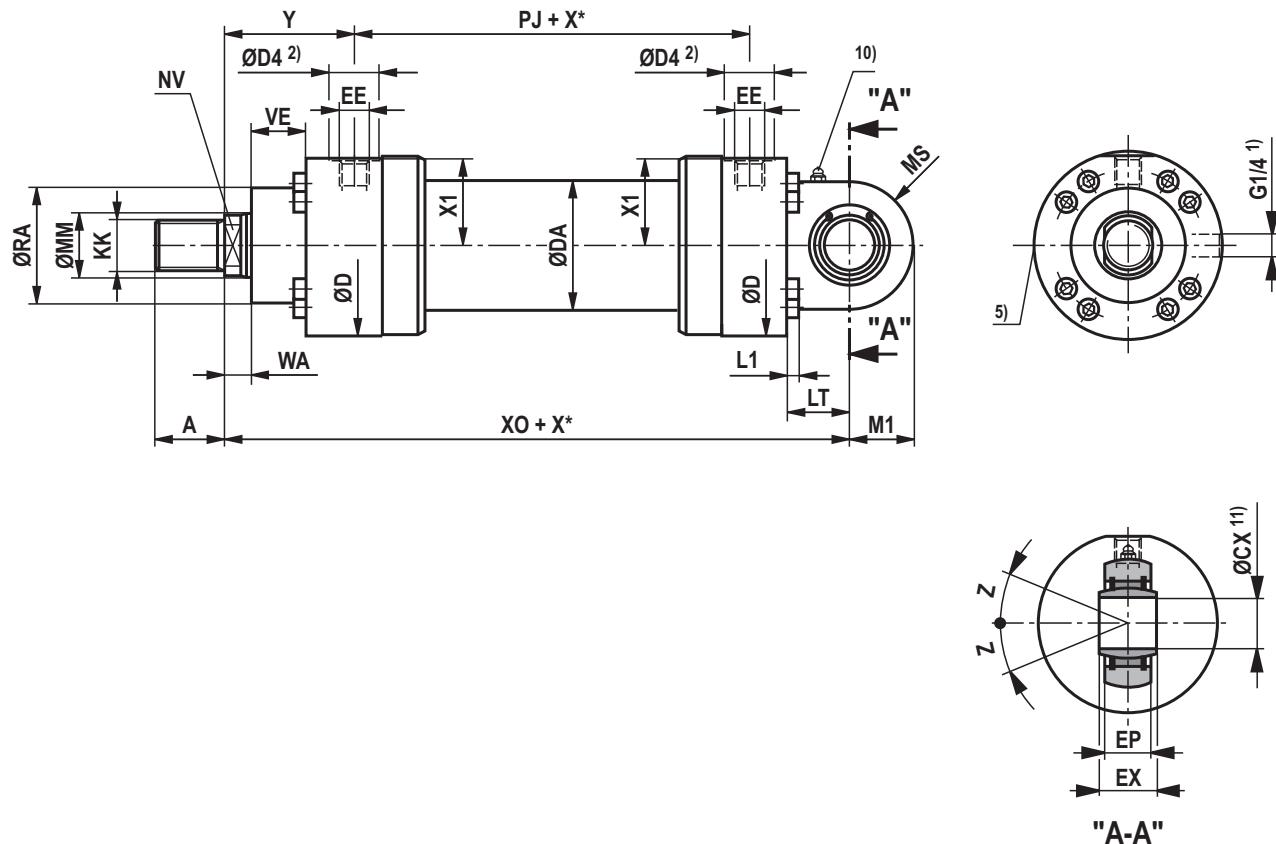

grease nipple cone head form A according to DIN 71412

11) Related bolt-Ø f8

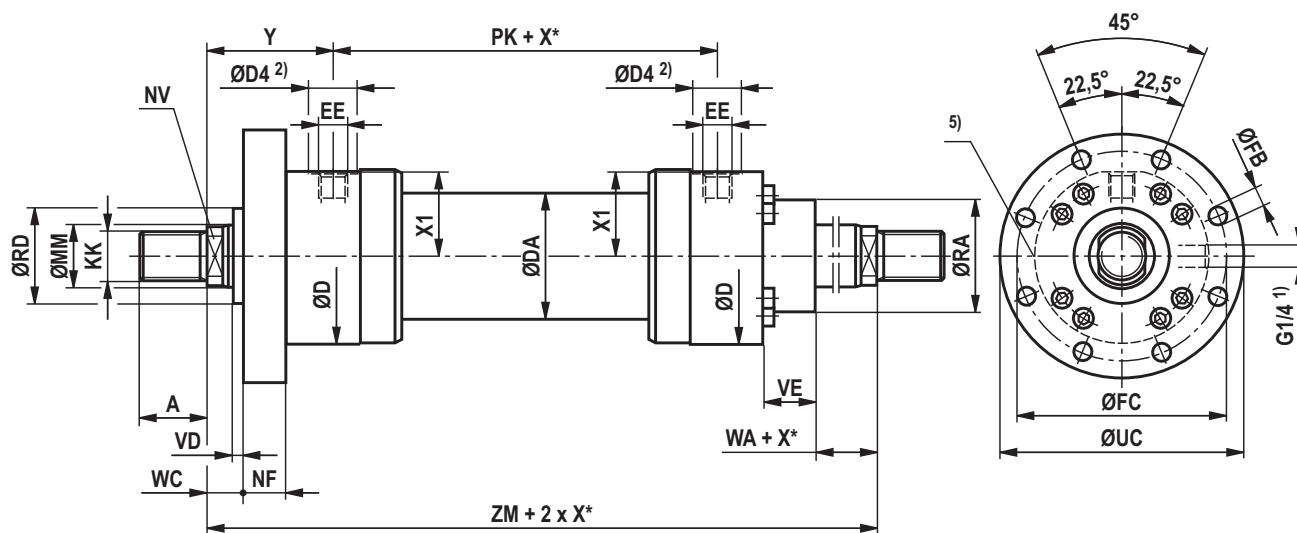

12) The specified dimensions are maximum values, tolerance classes 342 according to ISO 9013 Thermal cutting

ØAL = Piston Ø

ØMM = Piston rod Ø

X* = Stroke length

X*min = Min. stroke length

1) Bleeding: With view to the piston rod, the position is offset by 90° in relation to the line connection (clockwise)

2) Ø D4 max. 0,5 mm deep

3) Thread size does not correspond to ISO 6022; M50 x 2 available upon request

4) Flange connections see separate table pages 36 and 37

5) Throttle valve only with end position cushioning "E" (180° for bleeding)

6) Piston Ø not standardized

7) Dimensions for cylinders with seal design M, T, G, L, R, S and V

8) Dimensions for cylinders with seal design A and B

10) Observe the min. stroke length "X*min"

11) Double-acting cylinder not standardized

12) When ordering, always specify the "XV" dimension in the clear text. Preferred XV dimension:
Observe the trunnion position in the cylinder center XVmin and XVmax

14) XVcent recommendation:

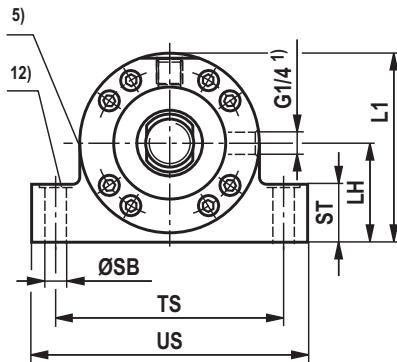

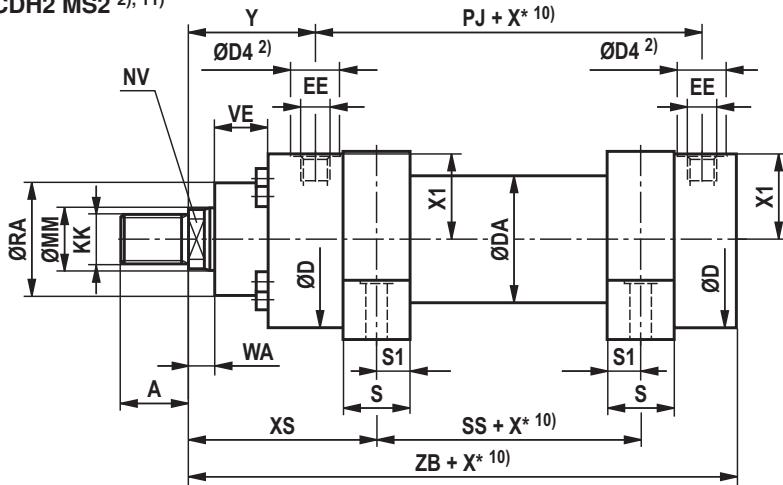

Trunnion position in cylinder center

15) The specified dimensions are maximum values, tolerance classes 342 according to ISO 9013 Thermal cutting

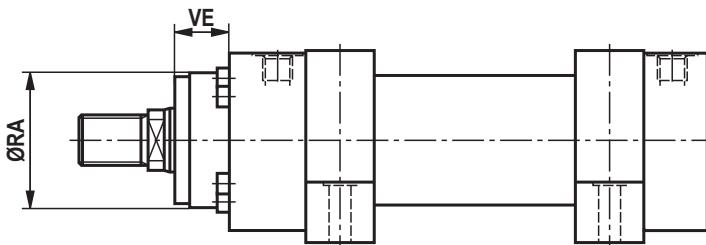

Important installation information: During installation, it must be ensured that the trunnion bearings are installed up to the trunnion shoulders. Any non-compliance may reduce the product's service life.

Foot mounting CDH2/CGH2: MS2

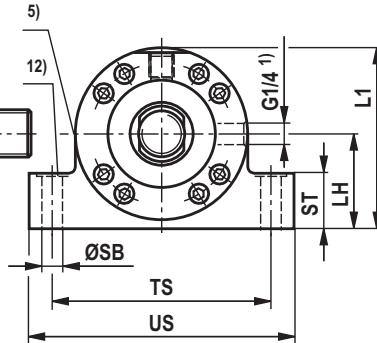

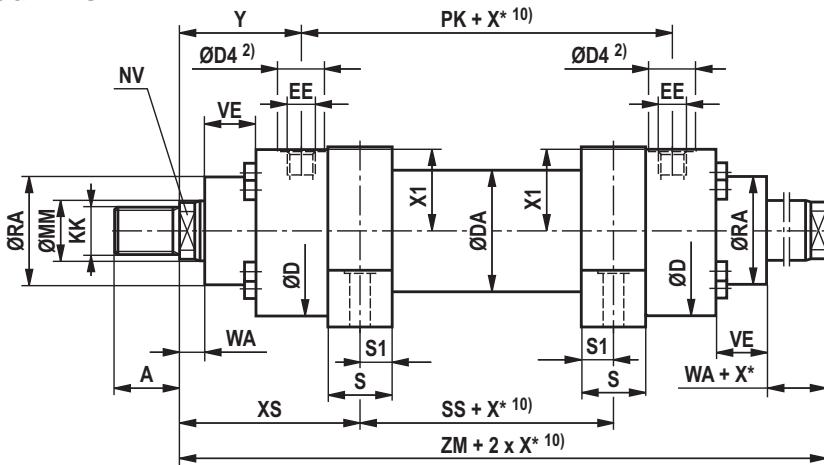

CDH2 MS2^{2), 11)}

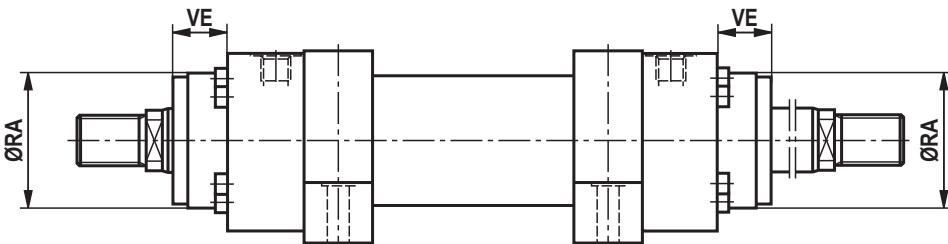

CDH2 MS2¹¹⁾: With seal design "A", "B" and ØAL 160 to 320 mm

CGH2 MS2¹¹⁾

CGH2 MS2¹¹⁾: With seal design "A", "B" and ØAL 160 to 320 mm

Ordering code series CSH2

- 1) Only piston Ø 40 to 200 mm
- 2) Trunnion position freely selectable. When ordering, always specify the "XV" dimension in the clear text in mm.
- 3) Max. available stroke length page 4 and admissible stroke length (acc. to buckling calculation) observe pages 60 to 62
- 4) Not possible with MF4
- 5) Piston Ø 40 to 80 mm, only position 11, subplates only possible in combination with line connection "B" at the head
- 6) Piston Ø 63 to 200 mm, only position 11, subplates only possible in combination with line connection "B" at the head
- 7) Piston Ø 125 to 200 mm, only position 11, subplates only possible in combination with line connection "B" at the head
- 9) Only piston Ø 80 to 320 mm
- 15) Subplates for SL and SV valves (isolator valves)
Note: Seal designs T, G, L, R, S and V are not designed for the static holding function!
- 18) Not standardized
- 19) Only piston rod Ø 28 to 140 mm
- 20) Possible from piston rod Ø 45 mm
- 21) Only piston Ø 63 to 200 mm
- 29) With CSH, by default with guide belts
- 30) All graphical presentations in the data sheet show position 1
- 31) With MS2, only position 11 is possible
- 32) Piston Ø 180 to 200 mm, only position 11, subplates only possible in combination with line connection "B" at the head
- 33) Version does not comply with ISO 6022

ØAL = Piston Ø

ØMM = Piston rod Ø

X* = Stroke length

X*max = Max. stroke length

X*min = Min. stroke length

1) Bleeding: With view to the piston rod, the position is offset by 90° in relation to the line connection (clockwise)

2) Ø D4 max. 0,5 mm deep

3) Thread size does not correspond to ISO 6022; M50 x 2 available upon request

4) Flange connections see separate table pages 36 and 37

5) Throttle valve only with end position cushioning "E" (180° for bleeding)

6) Piston Ø not standardized

10) Observe the min. stroke length "X*min"

11) Double-acting cylinder not standardized

12) When ordering, always specify the "XV" dimension in the clear text. Preferred XV dimension:

Observe the trunnion position in the cylinder center XVmin and XVmax

14) XVcent recommendation:

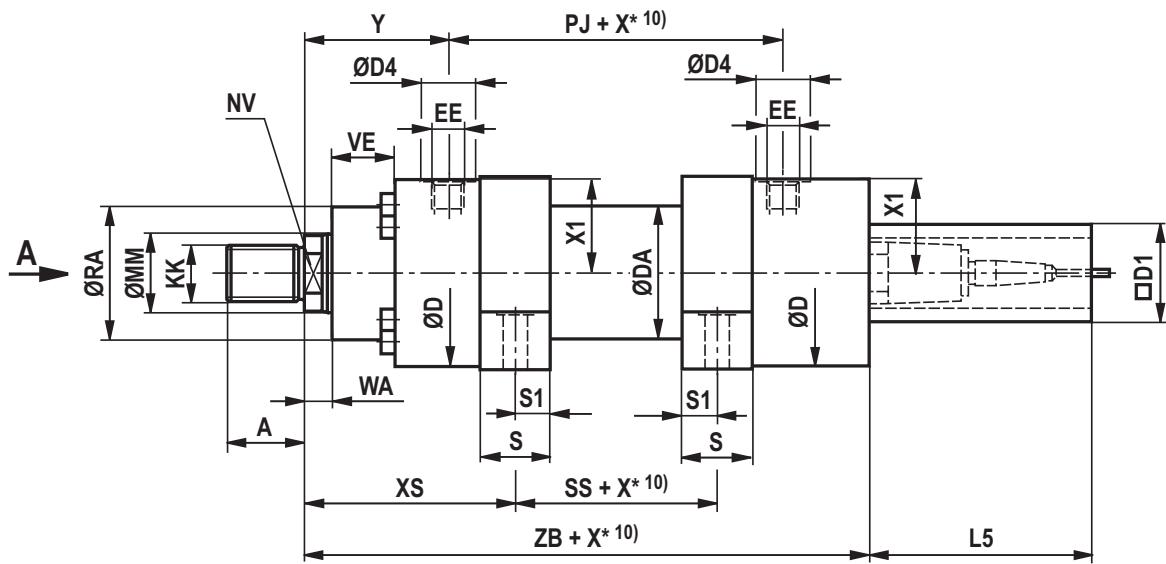

Trunnion position in cylinder center

15) The specified dimensions are maximum values, tolerance classes 342 according to ISO 9013 Thermal cutting

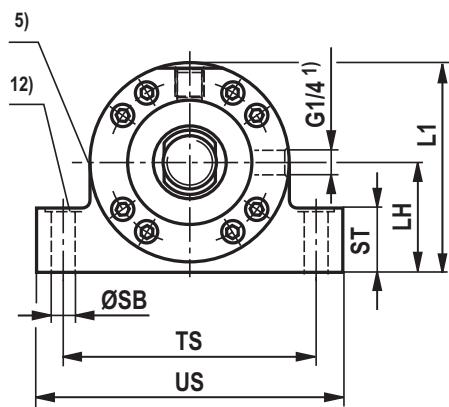

Important installation information: During installation, it must be ensured that the trunnion bearings are installed up to the trunnion shoulders. Any non-compliance may reduce the product's service life.

Main dimensions see pages 6 to 17

ØAL = Piston Ø

X* = Stroke length

¹⁾ Thread depth for seal design M, T, G, L, R, S and V

²⁾ Thread depth for seal design A and B

³⁾ Max. operating pressure for related flanges in bar

⁴⁾ Flange porting pattern according to ISO 6162-1 tab.2 type 1 corresponds to flange porting pattern according to SAE 3000 PSI

⁵⁾ Flange porting pattern according to ISO 6162-2 tab.2 type 1 corresponds to flange porting pattern according to SAE 6000 PSI

⁶⁾ Version "F" with piston Ø 125 to 200 mm not standardized

⁷⁾ Version "K" with piston Ø 40 to 50 mm and piston Ø 180 to 200 mm not standardized

⁸⁾ Versions "D" and "H" not standardized

Subplates for valve mounting (SL and SV valve)

Note:

Valves, fittings and piping are **not** included in the scope of delivery!

- 1 Port B to the piston side according to ISO 6164
- 2 Bore for locating pin
- 3 Adapter plate for MT4 type of mounting (part of the scope of delivery for MT4)
- 4 Line connection "B" dimensions see also pages 10 to 21 and pages 24 to 35

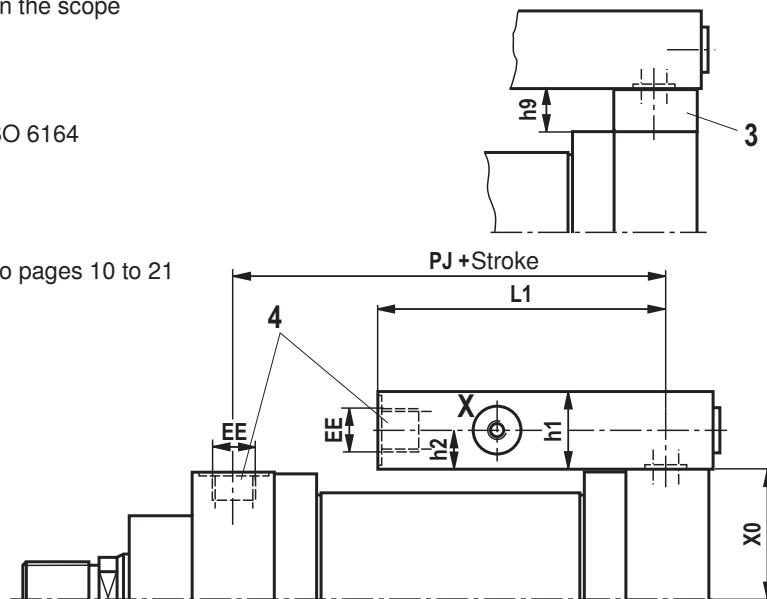

Important notice

Subplates for SL and SV valves (isolator valves)

Note:

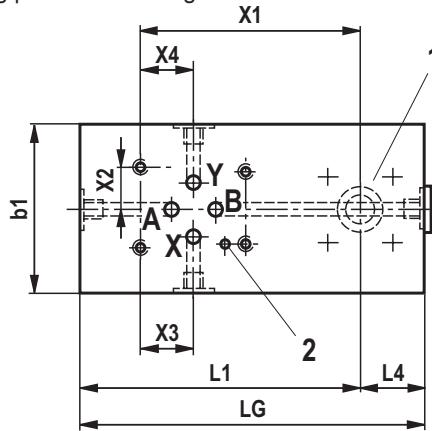

Seal designs T, G, L, R, S and V are not designed for the static holding function!

Installation situation with MT4

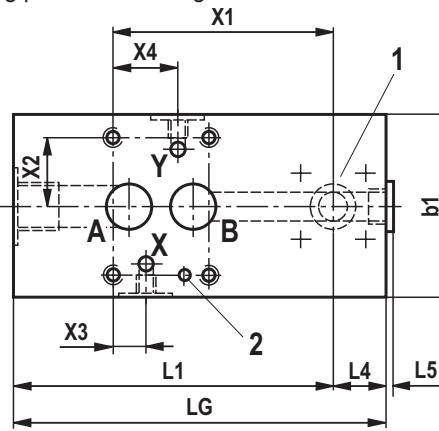

Size 6

Porting pattern according to DIN 24340 form A and ISO 4401

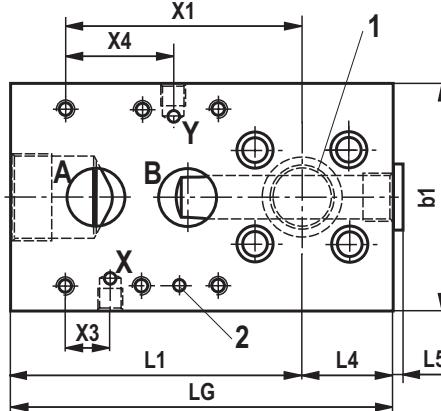

Size 10 and 20

Porting pattern according to ISO 5781

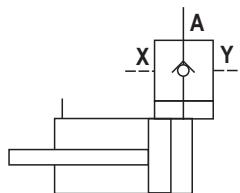

Size 30

Porting pattern according to ISO 5781

Piping symbol

ØAL = Piston Ø

²⁾ Only for MT4¹⁾ Not for MT4

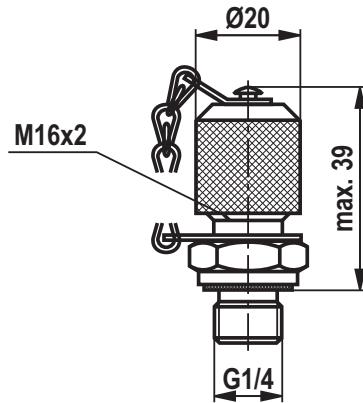

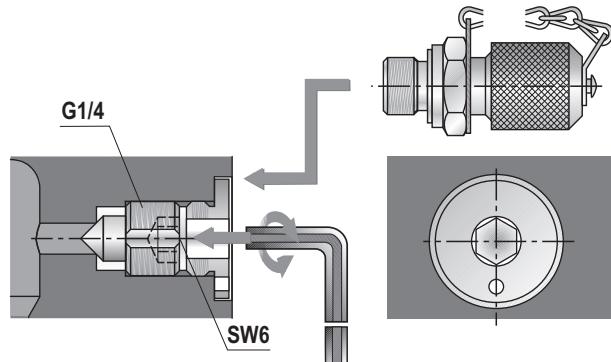

Bleeding / threaded coupling (dimensions in mm)

By default, a patented safety bleeding device against unintended screwing out in head and base is delivered for all cylinders.

The port allows for the installation of a threaded coupling with check valve for pressure measurement or contamination-free bleeding. Threaded coupling with check valve function, i.e. it can also be connected when the system is pressurized.

- ¹⁾ Bleeding: With view to the piston rod, the position is offset by 90° in relation to the line connection (clockwise)

Scope of delivery: Threaded coupling **G1/4**

Proxiwity switch

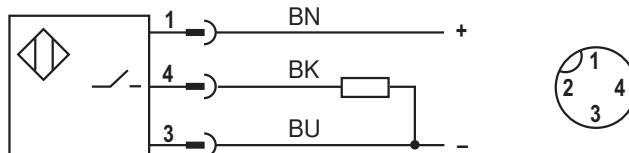

Inductive proxiwity switches are used as reliable end position control for hydraulic cylinders. They are an important element for the safe and exact monitoring of safety equipment, lockings and/or other machine functions in their end position by means of the output of signals. The proxiwity switch which is high-pressure-resistant up to 500 bar works in a con-

tactless manner. Consequently, it is wear-free. The proxiwity switch is set at the factory. The switching distance must not be adjusted. The lock nut of the proxiwity switch is marked at the factory using sealing wax. On versions with proxiwity switch, the cylinders are provided with proxiwity switches on both sides.

Position measurement system

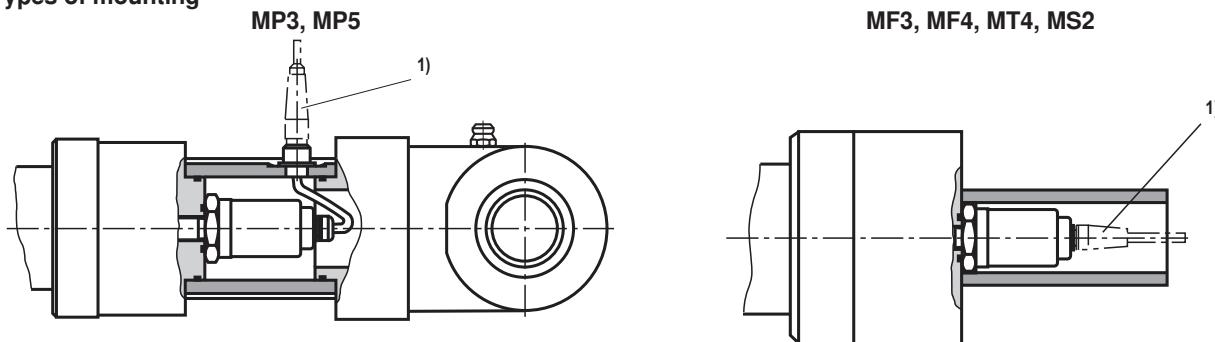

The position measurement system that is pressure-resistant up to 500 bar works in a contactless and absolute manner. The basis of this position measurement system is the magnetostrictive effect. Here, the coincidence of two magnetic fields triggers a torsion pulse. This pulse runs on the waveguide inside the gauge from the measuring point to the sensor head. The running time is constant and almost temperature-independent. It is proportional to the position of the solenoid and thus a measure for the actual position value and is converted in the sensor into a direct analog or digital output.

Technical data (For applications outside these parameters, please consult us!)

Operating pressure		bar	250

Buckling

The admissible stroke length with flexibly guided load and a factor of 3.5 for safety against buckling can be seen from the relevant table. For other installation positions of the cylinder, the admissible stroke length must be interpolated. Admissible stroke length for non-guided load on request.

Buckling calculations are carried out according to the following formulas:

1. Calculation according to Euler

$$F = \frac{\pi^2 \cdot E \cdot I}{v \cdot L_K^2} \quad \text{if } \lambda > \lambda_g$$

2. Calculation according to Tetmajer

$$F = \frac{d^2 \cdot \pi (335 - 0.62 \cdot \lambda)}{4 \cdot v} \quad \text{if } \lambda \leq \lambda_g$$

Explanation:

E = Module of elasticity in N/mm²
 $= 2.1 \times 10^5$ for steel

I = Geometrical moment of inertia in mm⁴

$$\text{for circular cross-section} = \frac{d^4 \cdot \pi}{64} = 0,0491 \cdot d^4$$

v = 3.5 (safety factor)

L_K = Free buckling length in mm (depending on the type of mounting see sketches A, B, C)

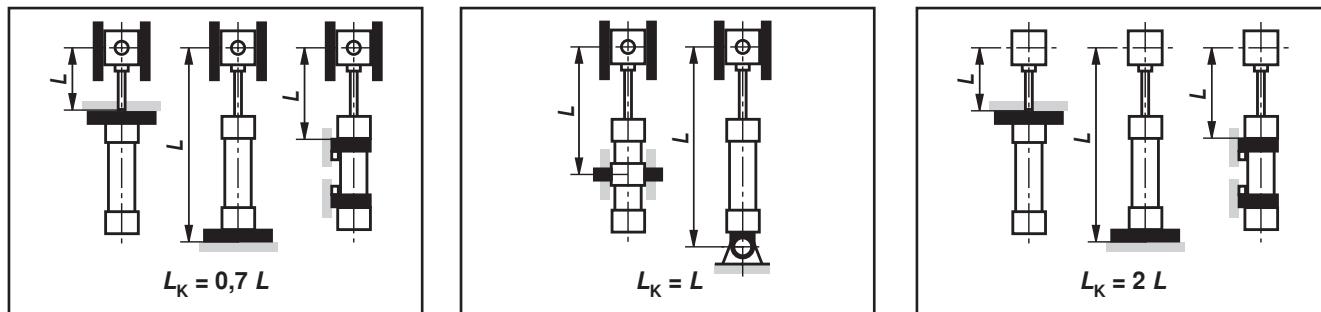

d = Piston rod Ø in mm

λ = Slenderness ratio

$$= \frac{4 \cdot L_K}{d} \quad \lambda_g = \pi \sqrt{\frac{E}{0.8 \cdot R_e}}$$

R_e = Yield strength of the piston rod material

Influence of the type of mounting on the buckling length:

¹⁾ Adm. Stroke length

With longer strokes, an extended guide and/or the use of guide rings may be reasonable for increasing the service life, depending on the respective application and installation position. Recommendation on request.

²⁾ With CSH2, observe the maximum stroke length "X*max", pages 24 to 35

End position cushioning

End position cushioning:

The objective is to reduce the velocity of a moved mass, whose center of gravity lies on the cylinder axis to a level, at which neither the cylinder nor the machine into which the cylinder is installed is damaged. For velocities above 20 mm/s, we recommend the use of an end position cushioning feature, which absorbs energy without requiring the use of additional equipment. It must, however, always be verified whether end position cushioning is also required for lower velocities with large masses.

Damping capacity:

When decelerating masses via end position cushioning, the structural-inherent cushioning capacity must not be exceeded. Cylinders with end position cushioning can achieve their full cushioning capacity only over the entire stroke length.

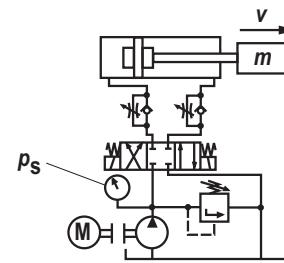

With the adjustable end position cushioning version "E", a throttle valve is additionally provided when compared with version "D". End position cushioning version "E" allows cycle times to be optimized. The maximum cushioning capacity can only be achieved when the throttle valve is closed.

The calculation depends on the factors weight, velocity, system pressure and installation position. For this reason, mass and velocity are used to determine the characteristic D_m and system pressure and installation position to determine the characteristic D_p .

These two characteristics are used for verifying the admissible damping capacity in the "damping capacity" diagram. The intersection point of the characteristics D_m and D_p must always be below the damping capacity curve of the selected cylinder. The values in the diagrams refer to an average oil temperature of +45 to +65 °C with the throttle valve being closed.

For special applications with very short stroke times, high velocities or large masses, cylinders with special end position cushioning versions can be offered on request.

When fixed or adjustable stops are used, special measures must be taken!

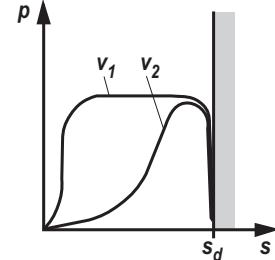

Formulas:

$$D_m = \frac{m}{10^K} ; K = kv(0,5-v)$$

m = Moved weight in kg

v = Stroke velocity in m/s

kv = See table page 64

Extension for CDH2 and CSH2

$$D_p = p_s - \frac{m \cdot 9,81 \cdot \sin\alpha}{A_1 \cdot 10}$$

Retraction for CDH2, CGH2 and CSH2; extension for CGH2

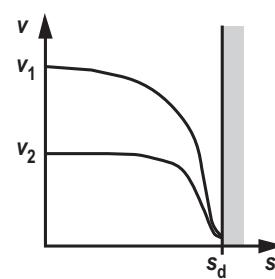

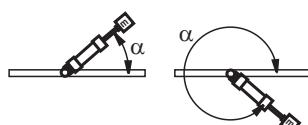

$$D_p = p_s + \frac{m \cdot 9,81 \cdot \sin\alpha}{A_3 \cdot 10}$$

p_s = System pressure in bar

A_1 = Piston area in cm² (see page 4)

A_3 = Annulus area in cm² (see page 4)

α = Angle to the horizontal in degrees

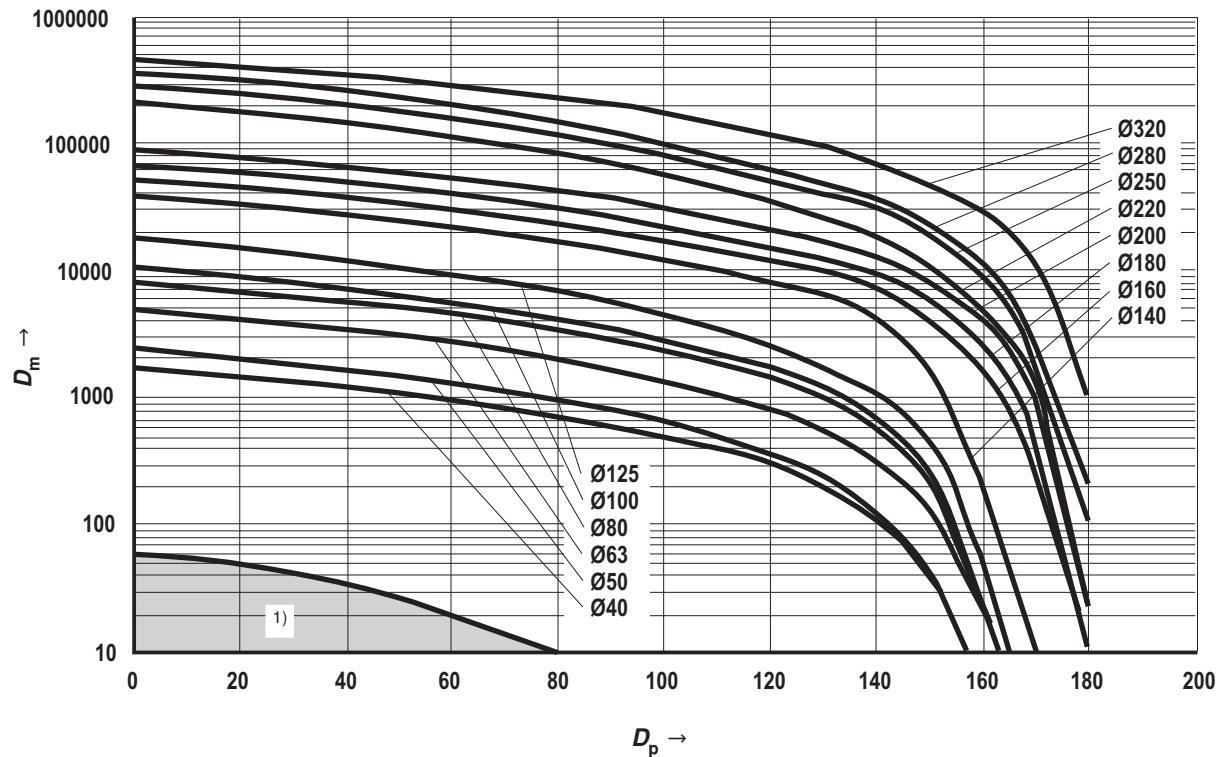

Damping length
