

HARLEX

Hydraulic cylinder Tie rod design

Component series 2X
Nominal pressure 160 bar (16 MPa)

Series CDT3...Z; CGT3...Z; CST3...Z

Features

- Installation dimensions according to ISO 6020-2, DIN 24554 and NF/ISO 6020-2
- 13 types of mounting
- Piston Ø (**ØAL**): 25 to 200 mm
- Piston rod Ø (**ØMM**): 12 to 140 mm
- Stroke lengths up to 2700 mm
- Integrated guide socket for fast and easy maintenance
- Self-adjusting or adjustable end position cushioning as option
- Patented safety bleeding device for easy and safe bleeding
- Easy assembly thanks to freely selectable position of the line connections at head and base

Technical data (For applications outside these parameters, please consult us!)

Nominal pressure:	160 bar (16 MPa)
Maximum operating pressure (only static load):	210 bar (21 MPa)
Static test pressure:	240 bar (24 MPa)

Cylinders of this series are designed for a nominal pressure of 160 bar and in version CD for a maximum operating pressure of 210 bar with static load.

(Static load: Less than 10,000 load cycles over the entire life cycle)

The admissible dynamic operating pressure amounts to 75 % of the maximum operating pressure with maximum amplitude and oscillatory load.

The specified operating pressures apply to applications with shock-free operation with regard to excess pressure and/or external loads. With extreme loads like e.g. high cycle sequence, mounting elements and threaded piston rod connections must be designed for durability.

Minimum pressure:

Depending on the application, a certain minimum pressure is required in order to guarantee good functioning of the cylinder. Without load, a minimum pressure of 20 bar is recommended for differential cylinders; for lower pressures as well as double-acting cylinders, please contact us.

Installation position: Any

Hydraulic fluid:

Mineral oils DIN 51524 HL, HLP
Oil-in-water emulsion HFA
Water glycol HFCP
Phosphate ester HFD-R

Hydraulic fluid temperature range: See page 61

Ambient temperature range: See page 61

Optimum viscosity range: 20 to 100 mm²/s

Minimum admissible viscosity: 2.8 mm²/s

Maximum admissible viscosity: 380 mm²/s

Cleanliness class according to ISO

Maximum admissible degree of contamination of the hydraulic fluid according to ISO 4406 (c) class 20/18/15.

The cleanliness classes specified for the components need to be met in hydraulic systems. Effective filtration prevents faults and at the same time increases the life cycle of the components.

Bleeding:

By default: By default, hydraulic cylinders are primed with a coating (color gentian blue RAL 5010) of min. 40 µm. Other colors upon request.

With cylinders and attachment parts, the following surfaces are not primed or painted:

- All fit diameters to the customer side
- Sealing surfaces for line connection
- Sealing surfaces for flange connection
- Connection surface for valve mounting position measurement system

Accessories that are ordered as separate order item are not primed or painted by default. Corresponding priming and/or painting on request.

Technical data (For applications outside these parameters, please consult us!)

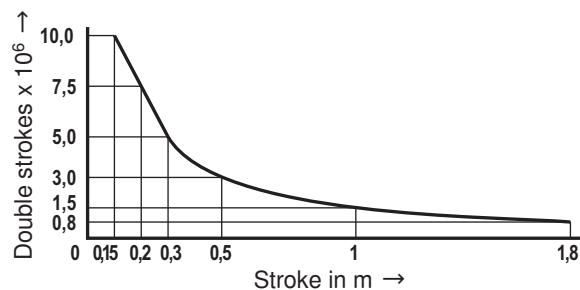

Boundary and application conditions:

- The mechanical alignment of the movement axis and thus the mounting points of hydraulic cylinder and piston rod must be ensured. Lateral forces on the guides of piston rod and piston are to be avoided. It may be necessary to consider the own weight of the hydraulic cylinder (MP1, MP3, MP5, MT1, MT2 or MT4) or the piston rod.
- The kinking length/kinking load of the piston rod and/or the hydraulic cylinder must be observed (see page topic kinking).
- The maximum admissible stroke velocities with regard to the suitability/load of seals must be observed as must their compatibility with the properties of the fluid type (see page topic seals).
- The maximum admissible velocities/kinetic energies when moving into the end positions, also considering external loads, must be observed.
Danger: Excess pressure
- The maximum admissible operating pressure must be complied with in any operating state of the hydraulic cylinder. Possible pressure intensification resulting from the area ratio of annulus to piston area and possible throttling points are to be observed.
- Detrimental environmental influences, like e.g. aggressive finest particles, vapors, high temperatures, etc. as well as contaminations and deterioration of the hydraulic fluid are to be avoided.

Notice: This list does not claim to be complete. In case of questions regarding the compatibility with the medium or exceedance of the boundary or application conditions, please contact us.

Life cycle:

cylinders correspond to the reliability recommendations for industrial applications.
 ≥ 10000000 double strokes in idle continuous operation or 3000 km piston travel at 70 % of the maximum operating pressure, without load on the piston rod, with a maximum velocity of 0.5 m/s, with a failure rate of less than 5 %.

Acceptance:

Each cylinder is tested according to standard and in compliance with ISO 10100: 2001.

Safety instructions:

For the assembly, commissioning and maintenance of hydraulic cylinders, the operating instructions data sheet have to be observed!
 Service and repair works have to be performed by or by personnel especially trained for this purpose. No warranty is accepted for damage as a consequence of assembly, maintenance or repair works not performed.

Check lists for hydraulic cylinders:

Cylinders the characteristics and/or application parameters of which deviate from the values specified in the data sheet can only be offered as special version upon request. For offers, the deviations of the characteristics and/or application parameters must be described in the check lists for hydraulic cylinders.

Double-acting cylinders with continuous piston rod:

With this design type, the friction is considerably higher than with the "CD version" with simple piston rod.

Stroke tolerances:

According to ISO 6020-2, a stroke tolerance of 0/+2 mm is admissible for strokes up to 1250 mm; for larger strokes please contact us.

A tolerance of ± 0.3 mm is possible as option, smaller tolerances are not reasonable for tie rod cylinders.

Minimum strokes:

For the "MT4" mounting, the minimum stroke is to be observed due to the trunnion width, see pages 16 and 36.

When using end position cushioning, the minimum stroke must also be observed. With stroke lengths smaller than the cushioning length, we recommend selecting the cylinder without end position cushioning.

Support width extension and tie rod support are possible upon request.

Line connections:

The cylinders of series CDT3/CGT3 are supplied with pipe thread or enlarged pipe thread according to ISO 1179-1 or metric ISO thread according to ISO 6149-1.

The cylinders of series CST3 are supplied with pipe thread according to ISO 1179-1 or with subplate.

Stroke velocity:

See information on stroke length and stroke velocity, higher stroke velocity on request.

If the extension velocity is considerably higher than the retraction velocity of the piston rod, drag-out losses of the medium may result. If necessary, please consult us.

Information on stroke length and stroke velocity

	Seal design T, S						1				

Project planning software ICS (Interactive Catalog System)

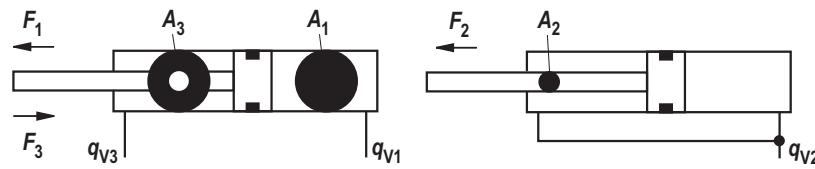

The ICS (Interactive Catalog System) is a selection and project planning aid for hydraulic cylinders. The ICS allows designers for machines and systems to quickly and reliably find the perfect hydraulic cylinder solution through logic-guided type key enquiries. This software helps to solve design and project planning tasks more quickly and efficiently. After having been guided through the product selection, the user quick-

ly and reliably gets the exact technical date of the selected component as well as 2D and 3D CAD data in the correct file format for all common CAD systems.

This allows users to reduce costs while increasing their competitiveness.

Ordering code: Series CDT3 (for operating pressure up to 210 bar)

The preferred cylinder designs are marked in gray.

Order example:

CDT3MP5/50/36/300Z2X/B11HHDWW

When selecting, please observe the limitations on the corresponding catalog pages!

- 1) Trunnion position freely selectable; when ordering, always specify the "XV" dimension in the clear text in mm
 - 2) Not ISO standardized
 - 3) With type of mounting MS2 and piston Ø 25 and end position cushioning, "E" is not possible
 - 4) With piston Ø 25 to 100 mm: Only line connection "B" possible
With piston Ø 125 to 200 mm: Only DIN types of mounting and line connection "B" possible
 - 5) Not possible with type of mounting MX1 and MX3
 - 6) See page 44 (Only with standardized piston rod Ø 22 to 140 mm possible), observe the max. operating pressure
 - 11) Observe the max. stroke length available, page 5, and the admissible stroke length (according to kinking calculation) on pages 52 to 55
 - 12) See page 44 (Only with standardized piston rod Ø 18 to 140 mm possible), observe the max. operating pressure
 - 13) Observe the admissible piston rod Ø and assigned threads at the piston rod end for 210 bar (pages 5 and 10 to 27)

¹⁴⁾ For operating pressure up to 160 bar

¹⁵⁾ For operating pressure up to 210 bar

¹⁶⁾ Not possible with MT1

Not possible with MRI

ØAL = Piston Ø

ØMM = Piston rod Ø

X* = Stroke length

1) Thread for piston rod ends "F" and "H"

2) Thread for piston rod ends "D" and "K"

3) For piston rod ends "E" and "T" see page 44

5) "H" dimension always in line connection position
Exception ME5 head and ME6 base

6) For the position of the line connections and the bleeding
see page 41

7) Tightening torque see page 63

9) Flange thickness according to DIN 24554

10) ME5: For line connection position "1" and "3" at head

11) ME5: For line connection position "2" and "4" at head

12) Piston rod Ø not standardized

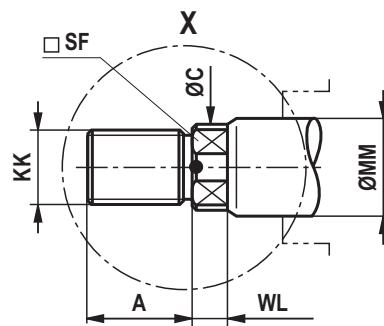

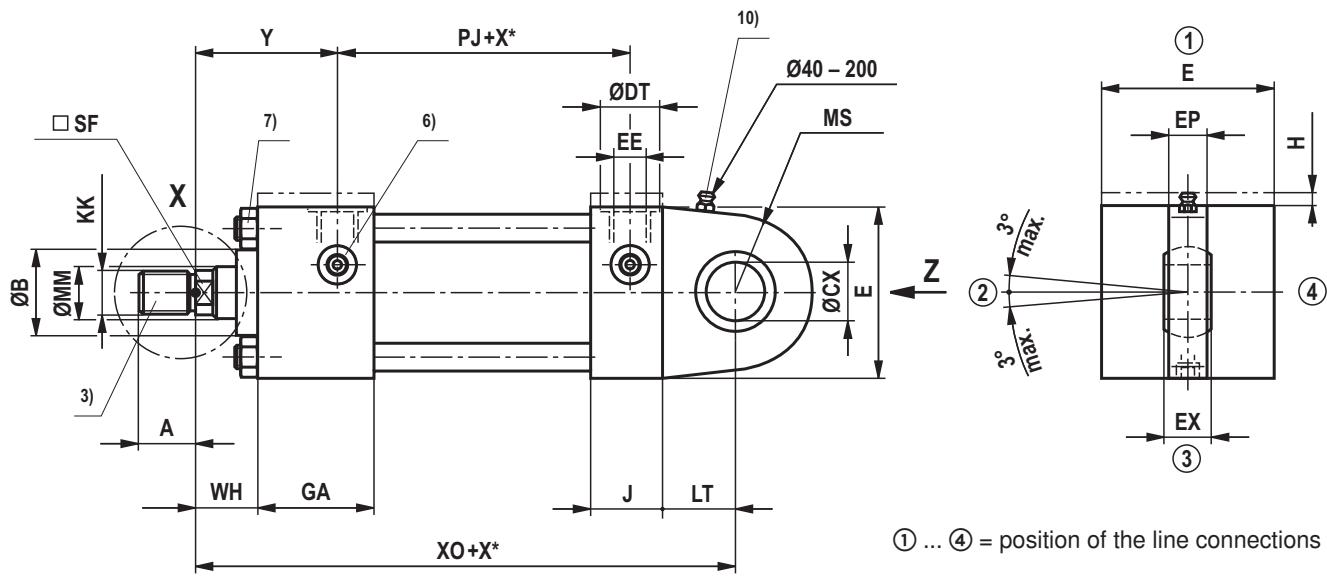

13) CG design: Piston rod marked with groove, only admissible for 50 bar tensile load

14) With operating pressures up to 210 bar only on request

ØAL = Piston Ø

ØMM = Piston rod Ø

X* = Stroke length

1) Thread for piston rod ends "F" and "H"

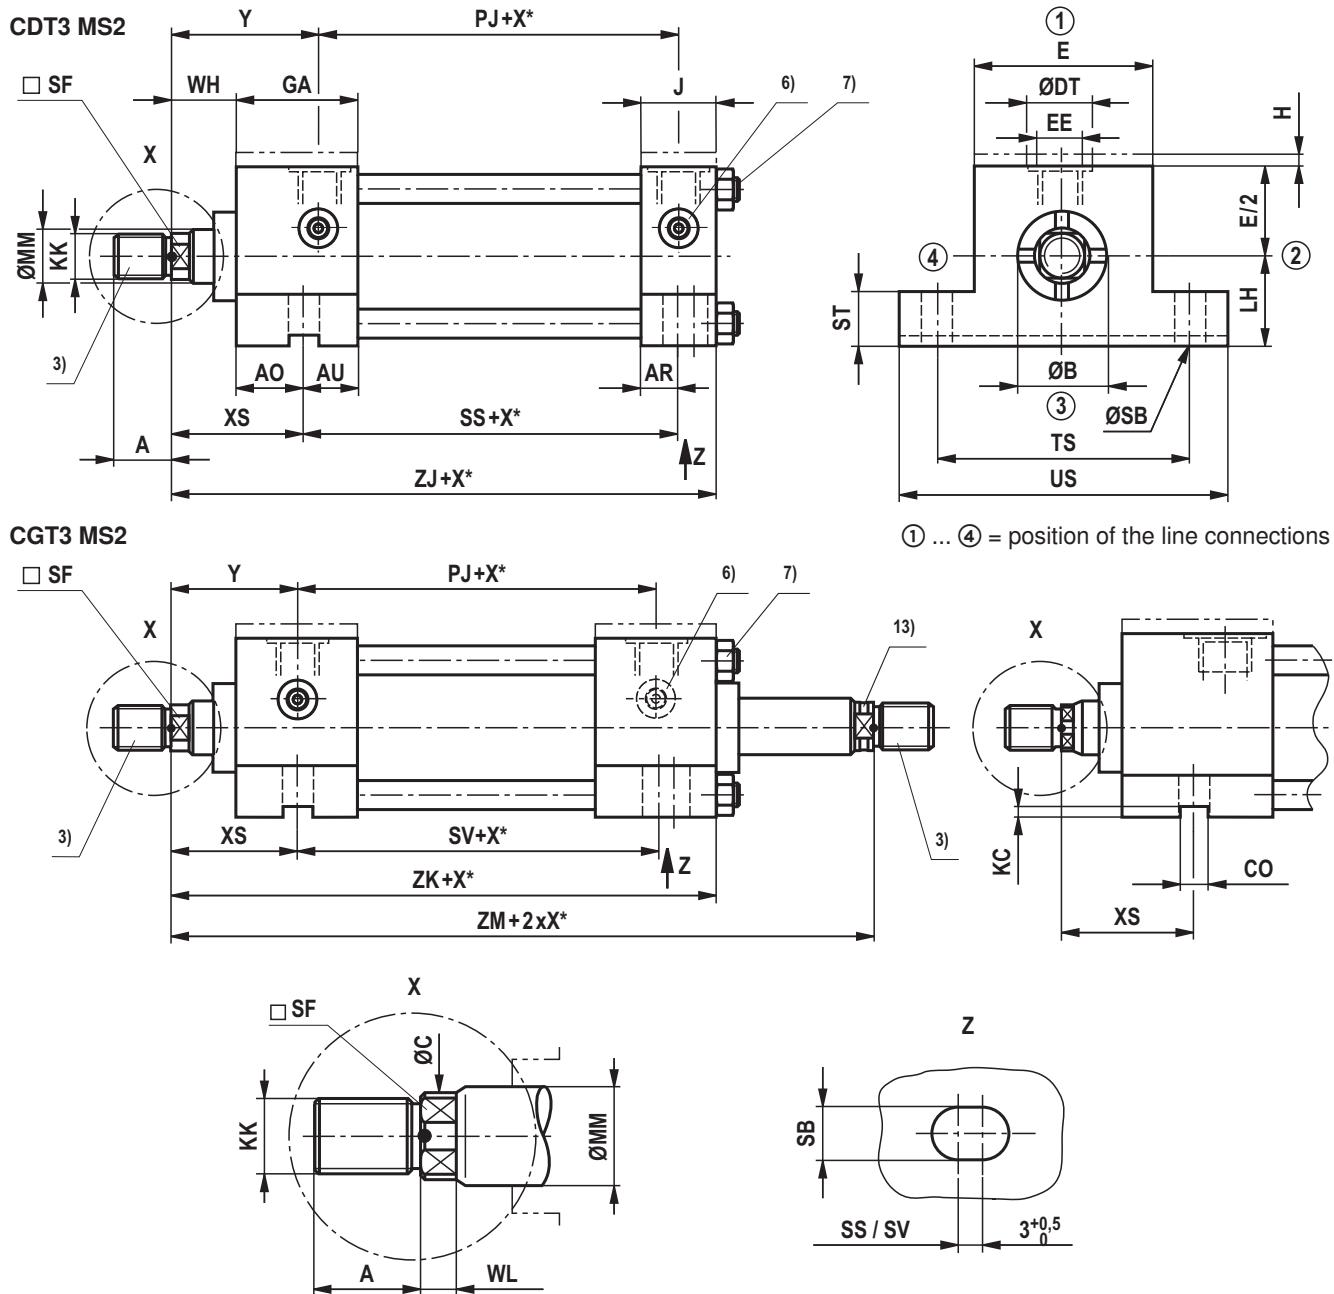

2) Thread for piston rod ends "D" and "K"

3) For piston rod ends "E" and "T" see page 44

5) "H" dimension always in line connection position

6) For the position of the line connections and the bleeding see page 41

7) Tightening torque see page 63

9) "XV" dimension in mm, always specify in the plain text

11) Piston Ø 25 and 32 mm: "H" dimension with line connection

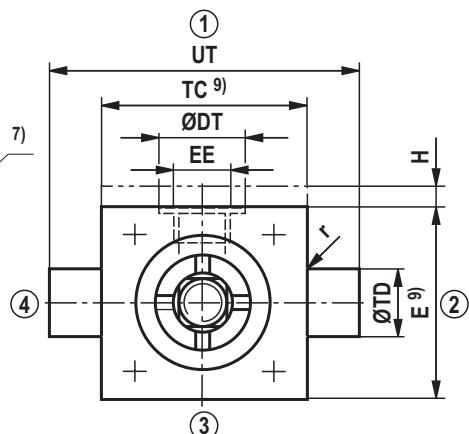

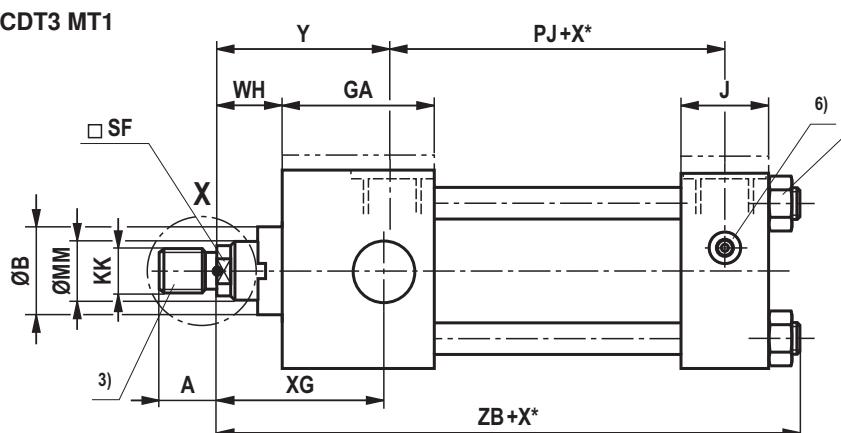

12) Piston rod Ø not standardized

13) CG design: Piston rod marked with groove, only admissible for 50 bar tensile load

14) With operating pressures up to 210 bar only on request

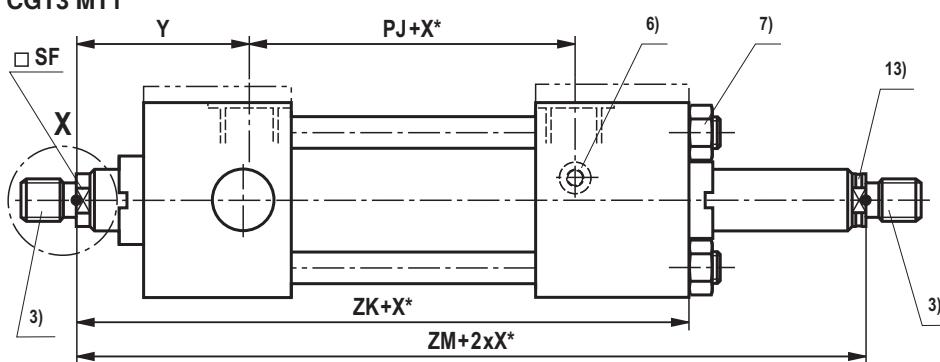

Dimensions: Type of mounting MT1, MT2 (dimensions in mm)

CDT3 MT1

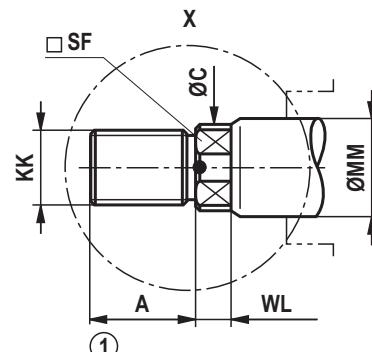

① ... ④ = position of the line connections

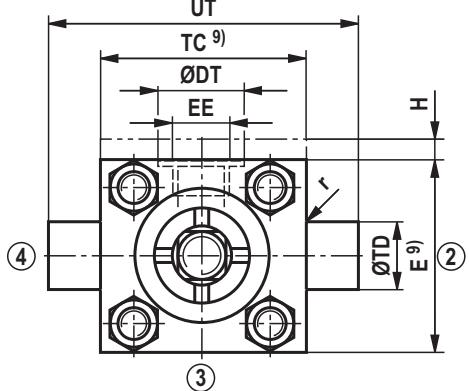

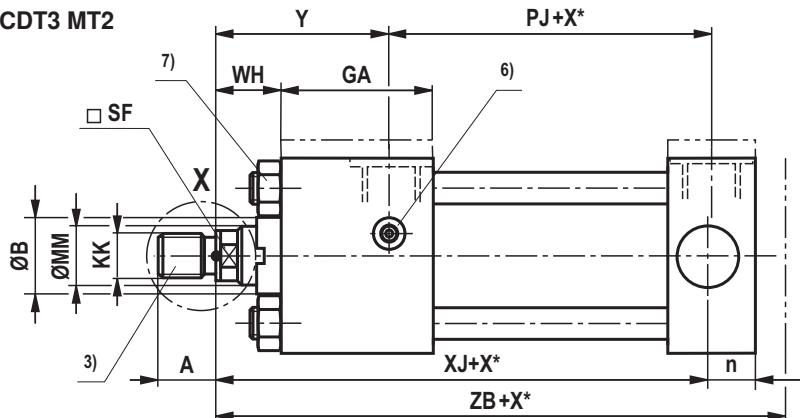

CGT3 MT1

We recommend lubricating the trunnions on a regular basis.

CDT3 MT2

Order example:
CST3ME5/50/36/300Z2X/P11HDUTTD
**When selecting, please observe the limitations on
the corresponding catalog pages!**
Comments:

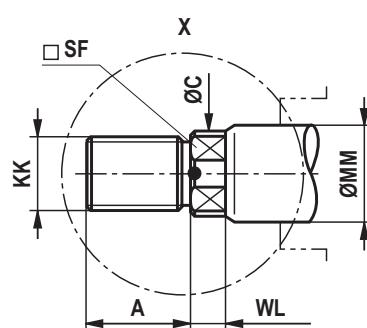

- 1) Trunnion position freely selectable; when ordering, always specify the "XV" dimension in the clear text in mm
- 8) Only position 11 possible
- 9) Only up to piston Ø 80 mm
- 10) Not standardized
- 11) Observe the max. and min. stroke length on pages 30 to 39 and the admissible stroke length (according to kinking calculation) on pages 52 to 55
- 15) Only piston Ø 100 – 200 mm

Dimensions: Type of mounting ME5 (dimensions in mm)

Leakage oil connection/enlarged line connection (dimensions in mm)

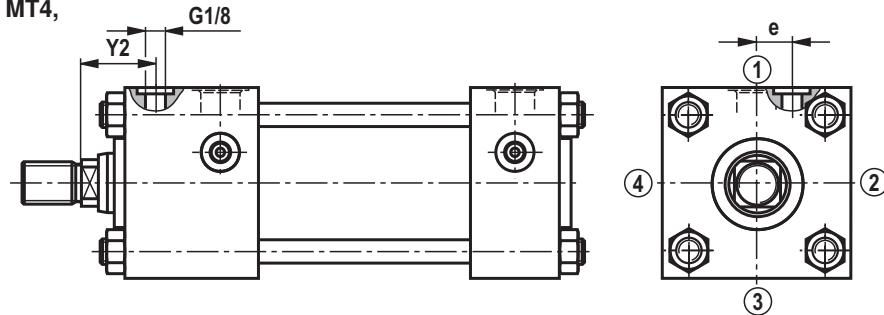

Leakage oil connection

If technical high-quality seals are used, use of a leakage oil connection is generally not necessary. A drag oil collection connection is only recommended in special cases such as extension velocity more than 2 times retraction velocity with larger strokes, permanent pressurization and the like. In case the extension velocities are more than 5 times the retraction velocity, please contact us.

**ME6, MP5, MS2, MT4,
Ø 25, 32, 40**

**ME5, ME6, MP5, MS2, MT4,
Ø 50 to Ø 200**

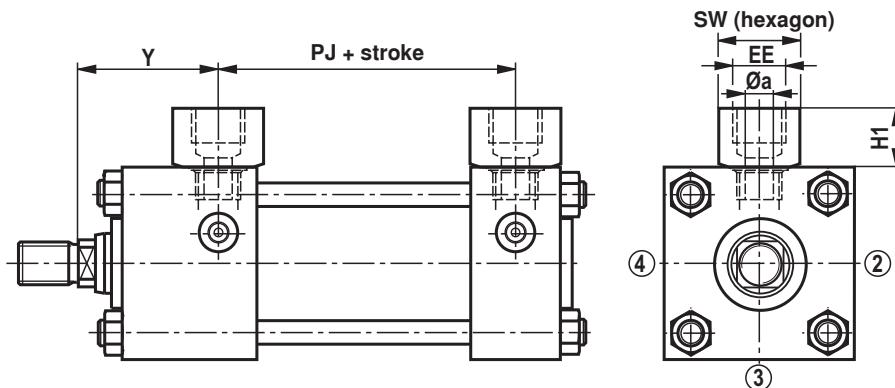

Enlarged line connection

The oil ports of this series are generously dimensioned according to the standard; with high velocities, the pressure drop Δp can be reduced by using larger oil ports; sometimes, it is, however, no longer possible to comply with the standard dimensions, see table.

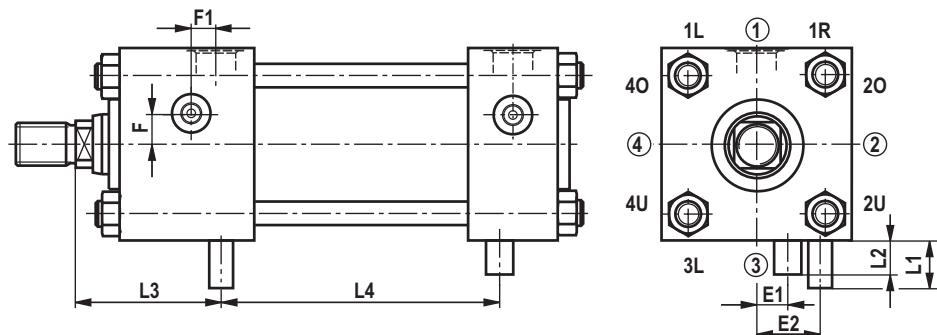

Cannot be realized for the types of mounting ME 5 / 6 with connection position 2 or 4.

Bleeding/threaded coupling (dimensions in mm)

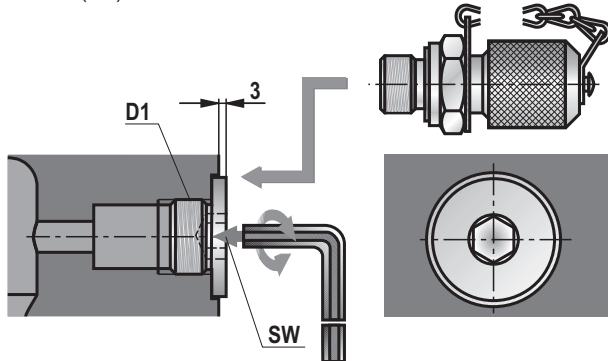

By default, a patented safety bleeding device against unintended screwing out in head and base is delivered for piston $\varnothing \geq 40$ mm.

For piston \varnothing 25 and 32 mm, a bleed screw G1/8 is installed in head and base which is **not** secured against screwing out.

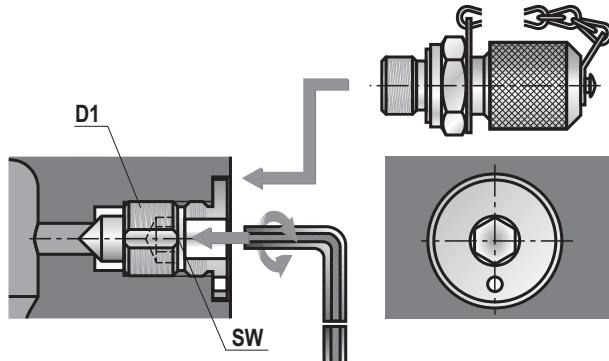

The port allows for the installation of a threaded coupling with check valve for pressure measurement or contamination-free bleeding. Threaded coupling with check valve function, i.e. it can also be connected when the system is pressurized.

Connection possibility for threaded coupling

Piston \varnothing (AL) 25 and 32 mm

Piston \varnothing (AL) 40 to 200 mm

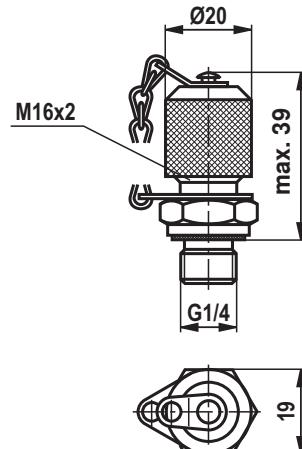

\varnothing AL	Bleed screw			Threaded coupling D2
	D1	Fuse	SW	
25 and 32	G1/8	not secured	5	G1/8
40 and 63	G1/8	secured	5	G1/8
80 to 200	G1/4	secured	6	G1/4

Scope of delivery: Threaded coupling **G1/8**

SCREW JOINT AB 20-11/K3 G1/8 with seal ring of NBR
SCREW JOINT AB 20-11/K3V G1/8 with seal ring of FKM

Scope of delivery: Threaded coupling **G1/4**

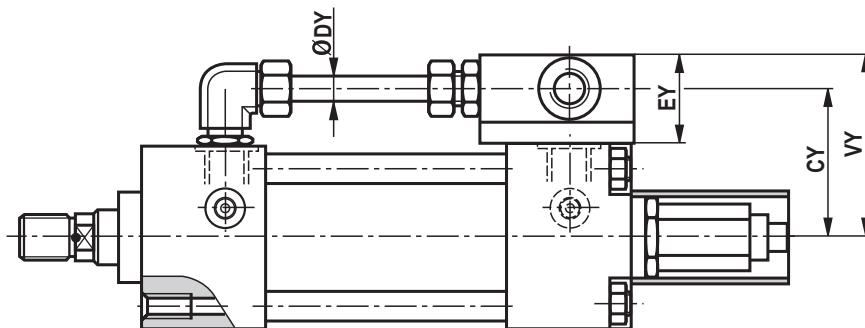

SCREW JOINT AB 20-11/K1 G1/4 with seal ring of NBR
SCREW JOINT AB 20-11/K1V G1/4 with seal ring of FKM

Position measurement system

The position measurement system that is pressure-resistant up to 500 bar works in a contactless and absolute manner. The basis of this position measurement system is the magnetostrictive effect. Here, the coincidence of two magnetic fields triggers a torsion pulse. This pulse runs on the waveguide inside the gauge from the measuring point to the sensor head. The running time is constant and almost temperature-independent. It is proportional to the position of the solenoid and thus a measure for the actual position value and is converted in the sensor into a direct analog or digital output.

Technical data: Position measurement system

(For applications outside these parameters, please consult us!)

Operating pressure		bar	160

Kinking

The admissible stroke length with flexibly guided load and a factor of 3.5 for safety against kinking can be seen from the relevant table. For other installation positions of the cylinder, the admissible stroke length must be interpolated. Admissible stroke length for non-guided load on request.

Kinking calculations are carried out according to the following formulas:

1. Calculation according to Euler

$$F = \frac{\pi^2 \cdot E \cdot I}{v \cdot L_K^2} \text{ if } \lambda > \lambda_g$$

2. Calculation according to Tetmajer

$$F = \frac{d^2 \cdot \pi (335 - 0.62 \cdot \lambda)}{4 \cdot v} \text{ if } \lambda \leq \lambda_g$$

Explanation:

E = module of elasticity in N/mm²
 $= 2.1 \times 10^5$ for steel

I = geometrical moment of inertia in mm⁴

for circular cross-section = $\frac{d^4 \cdot \pi}{64} = 0.0491 \cdot d^4$

v = 3.5 (safety factor)

L_K = free kinking length in mm (depending on the type of mounting see sketches A, B, C)

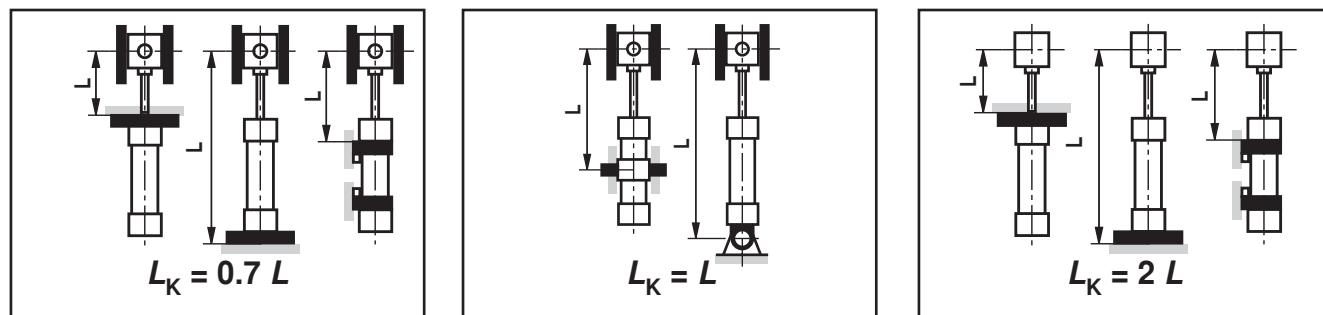

d = piston rod Ø in mm

λ = slenderness ratio

$$= \frac{4 \cdot L_K}{d} \quad \lambda_g = \pi \sqrt{\frac{E}{0.8 \cdot R_e}}$$

R_e = yield strength of the piston rod material

Influence of the type of mounting on the kinking length:

1) Adm. stroke length

End position cushioning

End position cushioning:

The objective is to reduce the velocity of a moved reduced mass, whose center of gravity lies on the cylinder axis to a level, at which neither the cylinder nor the machine into which the cylinder is installed is damaged.

For velocities above 20 mm/s, we recommend the use of an end position cushioning feature, which absorbs energy without requiring the use of additional equipment.

Series CDT3/CGT3 is equipped with a progressive cushioning system.

Advantages of this cushioning system:

- Progressive delay.
- Short cushioning time.
- Cushioning length depending on the velocity.
- Due to low cushioning pressures and no pressure peaks, safety and the life cycle of the cylinder and the machine are increased.
- Insensitive to changes in pressure, temperature and the moved masses.
- Controlled end stop velocity of the piston – more safety and reliability.
- Quick start-up due to special check valve and floating bushing.

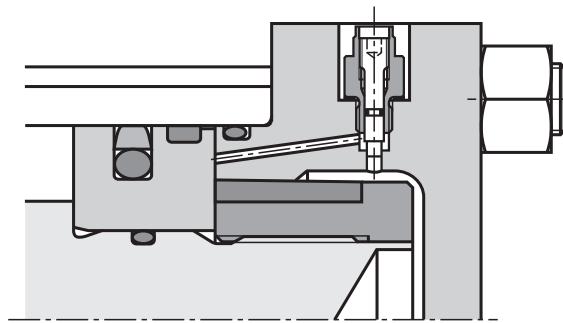

Cylinders with end position cushioning can achieve their full cushioning capacity only over the entire stroke length.

With the adjustable end position cushioning version "E", a throttle valve is additionally provided when compared with version "D". End position cushioning "E" allows for optimization of the cycle times.

The max. cushioning capacity can only be achieved when the throttle valve is closed.

For special applications with very short stroke times, high velocities or large masses, cylinders with special end position cushioning versions can be offered on request.

When fixed or adjustable stops are used, special measures must be taken!

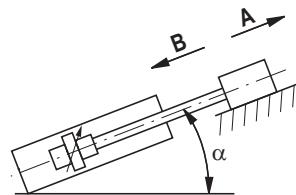

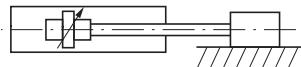

Cushioning capacity:

When decelerating masses via the end position cushioning, the structural-inherent cushioning capacity must not be exceeded.

To this end, the kinetic energy and potential energy of the moved mass are to be calculated and compared to the admissible values from the diagram on pages 58, 59.

Energy determination

$$E = \frac{1}{2} m \cdot v^2$$

$$1 \text{ Retract (A): } E = \frac{1}{2} m v^2 - mg \cdot I_a$$

$$1 \text{ Extend (B): } E = \frac{1}{2} m v^2 + mg \cdot I_a$$

$$1 \text{ Extend (A): } E = \frac{1}{2} m v^2 - mg \cdot I_a \cdot \sin \alpha$$

$$1 \text{ Retract (B): } E = \frac{1}{2} m v^2 + mg \cdot I_a \cdot \sin \alpha$$

E	[Nm] [joule]	Maximum value see pages 56 to 59
m	[kg]	Total moved mass incl. piston and rod
v	[m/s]	Max. velocity
g	[m/s ²]	9.81
I_a	[m]	Cushioning length, see page 57

¹⁾ In case *v_{max}* is exceeded, please contact us.

¹²⁾ Piston rod Ø not standardized

The diagrams on pages 58, 59 are based on the preceding table, the maximum velocities specified referring to "M" seals with closed throttle screw.

With slower velocities, the absorbing energy decreases according to the formula.

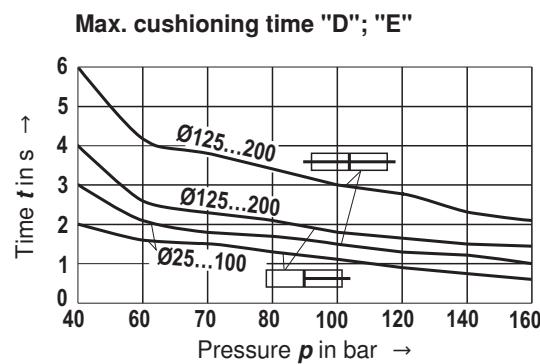

E_U = energy absorbing

E_{max} = energy max. see characteristic curve

v_U = stroke velocity

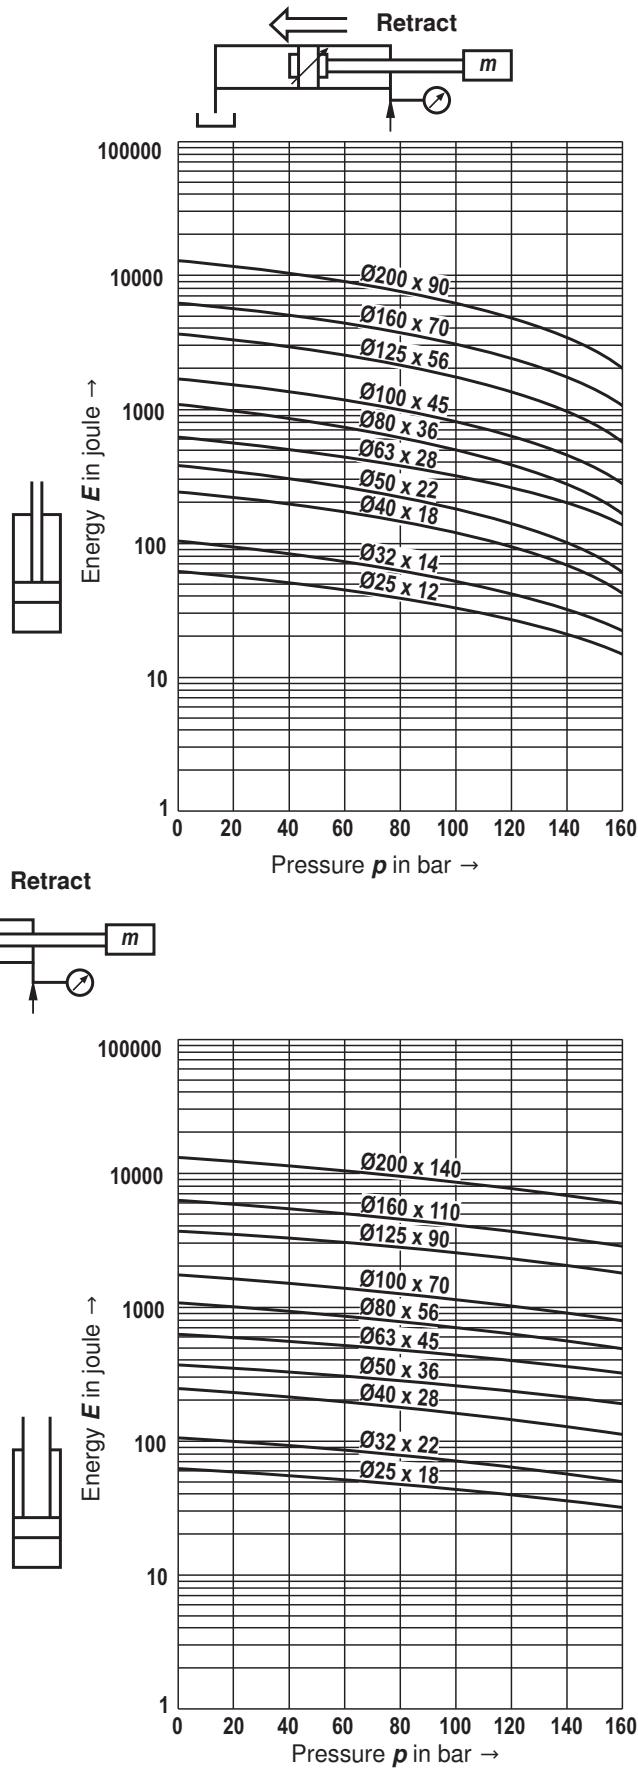

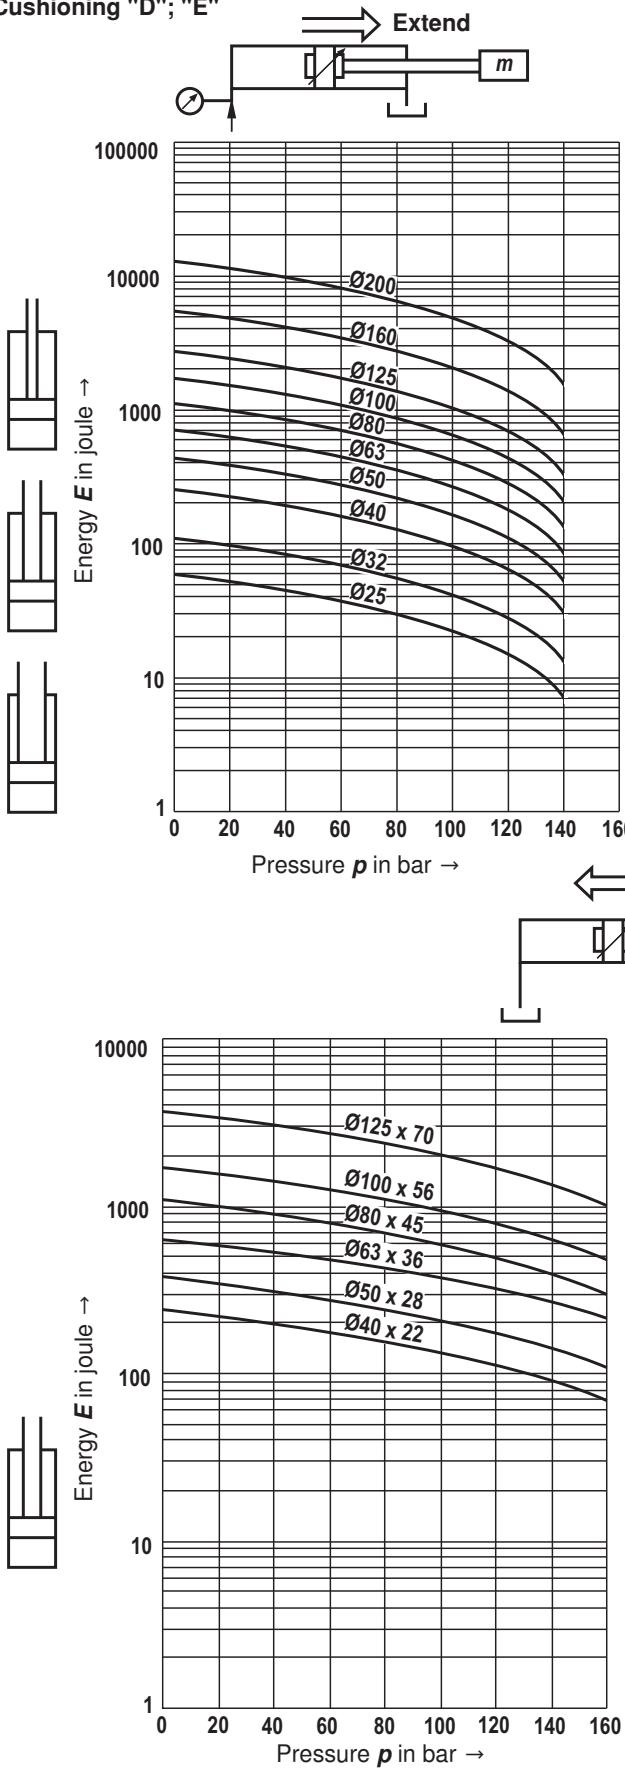

v_{max} = velocity max. for seal version "M"

$$E_U = E_{max} \cdot \frac{v_U}{v_{max}}$$

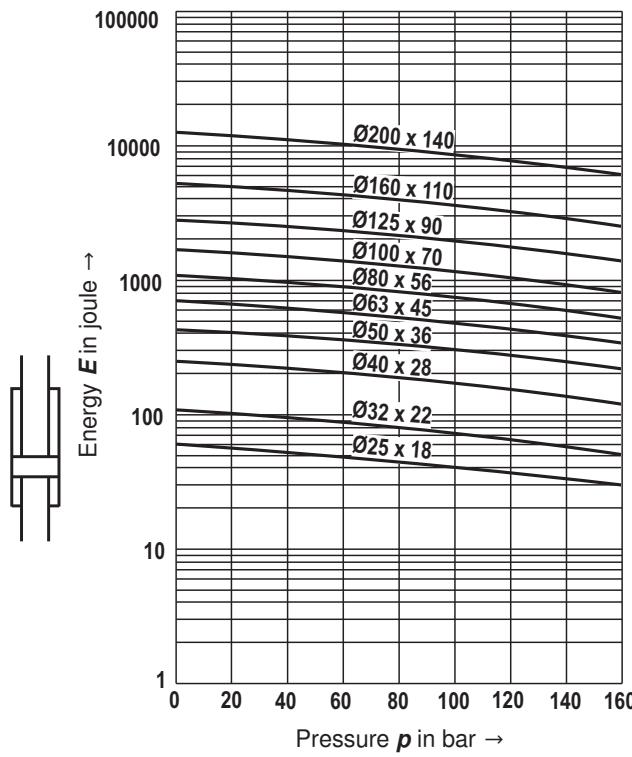

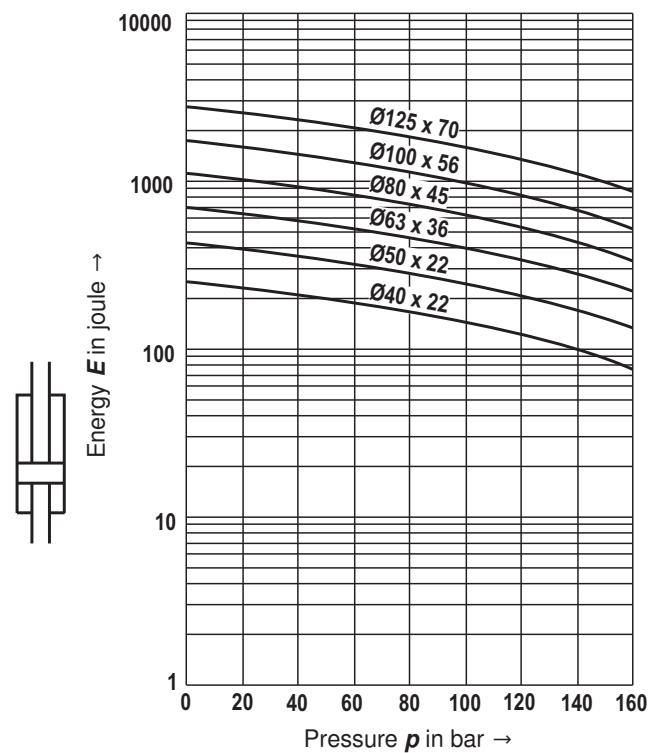

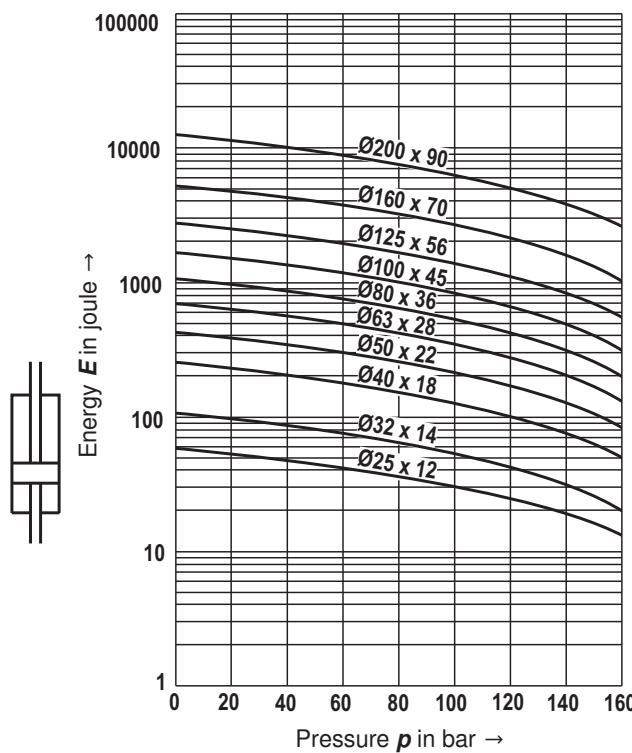

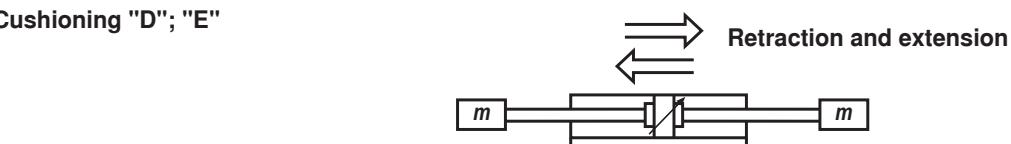

End position cushioning

Cushioning "D"; "E"

End position cushioning

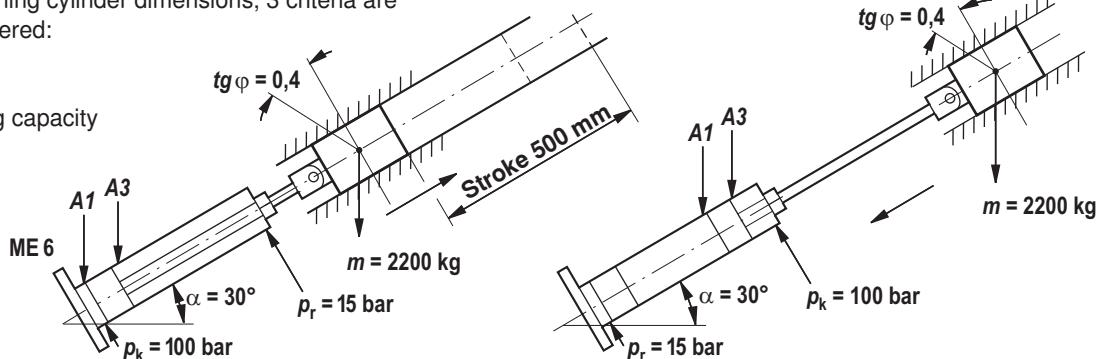

Cushioning "D"; "E"

Calculation example

When designing cylinder dimensions, 3 criteria are to be considered:

- Force
- Kinking
- Cushioning capacity

Example:

Stroke time = 2 seconds

Load friction coefficient = $\text{tg } \varphi = 0.4$ (estimated)

Available pressure $p_k = 100$ bar

Return flow pressure $p_r = 15$ bar

A1 = piston surface, **A3** = piston ring surface

φ = surface ratio **A1 / A3**, see page 5

m = total moved mass, **v** = velocity

I_a = cushioning length, see page 57

To be determined:

Piston and piston rod diameter

Extend piston rod:

Total efficiency $\eta = \eta_1 \cdot \eta_2$

η_1 = cylinder efficiency = 0.9 (estimated)

η_2 = system efficiency

$$\eta_2 = \frac{p_k \cdot A_1 - p_r \cdot A_3}{p_k \cdot A_1} = 1 - \frac{p_r}{p_k \cdot \varphi^{1)} } = \frac{15}{100 \cdot 1.25} = 0.88$$

$$\eta = 0.9 \cdot 0.88 = 0.79$$

¹⁾ Assuming the smallest " φ "

Force required to move the mass:

F = frictional force plus potential energy

$$\begin{aligned} &= \text{tg } \varphi \cdot m \cdot g \cdot \cos \alpha + m \cdot g \cdot \sin \alpha \\ &= 0.4 \cdot 2200 \cdot 9.81 \cdot 0.866 + 2200 \cdot 9.81 \cdot 0.5 = 18270 \text{ N} \\ &= 18.27 \text{ kN} \end{aligned}$$

This theoretical force 18.27 kN with $\eta = 0.79$ results in a required force = 23.13 kN and thus, a cylinder piston diameter = 63 mm is necessary for $p_k = 100$ bar, see page 5

Retract piston rod:

F = frictional force minus potential energy

$$\begin{aligned} &= \text{tg } \varphi \cdot m \cdot g \cdot \cos \alpha - m \cdot g \cdot \sin \alpha \\ &= 0.4 \cdot 2200 \cdot 9.81 \cdot 0.866 - 2200 \cdot 9.81 \cdot 0.5 \\ &= -3315 \text{ N} = -3.3 \text{ kN} \quad \text{no force problem during retraction} \end{aligned}$$

Test of kinking length:

For $p_k = 100$ bar and cylinder 63 / 28, the table on page 55 results in a maximum admissible stroke = 385 mm:

So the cylinder kinks

There are 2 possibilities:

- Select piston rod diameter 45,
max. admissible stroke = 1140 mm, i.e. kinking-proof
- Change the type of mounting, e.g. MS2
with a maximum admissible stroke = 915 mm

Test of the end position cushioning

Average velocity $0.5 / 2 = 0.25$ m/s

Max. velocity $v_u = 0.275$ m/s

(estimated correction coefficient = 1.1 due to start-up and braking)

Cushioning capacity required for piston rod extension =

$$\frac{m \cdot v_u^2}{2} - m \cdot g \cdot I_a \cdot \sin \alpha = \frac{2200 \cdot 0.275^2}{2} - 2200 \cdot 9.81 \cdot 0.025 \cdot 0.5 = -186 \text{ joules}$$

No cushioning problem for piston rod extension

Cushioning capacity required for piston rod retraction =

$$\frac{m \cdot v_u^2}{2} + m \cdot g \cdot I_a \cdot \sin \alpha = \frac{2200 \cdot 0.275^2}{2} + 2200 \cdot 9.81 \cdot 0.025 \cdot 0.5 = 353 \text{ joules}$$

Diagram on page 55 results in 445 joules for $p_k = 100$ bar and $v_{\max} = 0.4$ m/s, i.e. the cylinder can absorb energy for 0.275 m/s (see page 57):

$$E_u = E_{\max} \cdot \frac{v_u}{v_{\max}} = 445 \cdot \frac{0.275}{0.4} = 306 \text{ joules}$$

So the cylinder cannot absorb the necessary cushioning capacity:

you have to select the next larger diameter 80/56.

Selection criteria for seals

	Work and environmental conditions	Seal versions		
		M	T	S
Medium/temperature	Medium HL, HLP/operating temperature medium -20 °C to +80 °C	++	++	++
	Medium HFA/operating temperature medium +5 °C to +55 °C	+/-	++	+/-
	Medium HFC/operating temperature medium -20 °C to +60 °C	-	++	-
	Medium HFD-R/operating temperature medium -15 °C to +80 °C	-	-	++
	Medium HFD-U/operating temperature medium -15 °C to +80 °C	-	-	++
	Ambient and rod temperature in the area of the piston rod from -20 °C to +80 °C ¹⁾	++	+	++ ²⁾
	Extended ambient and rod temperature in the area of the piston rod from +80 °C to +120 °C	-	-	++
Function/velocity...	Static holding function more than 10 minutes: Attention! Application- and temperature-dependent	++	+	+
	Static holding function short-term < 1 minute	++	++	++
	Robust application conditions: Steel works, mining, thin ice	++	-	-
	Zero point control, hardly any amplitude, frequency max. 5 Hz, not longer than 5 minutes	-	++	++
	Cylinder velocity min. 0.001 m/sec stick-slip behavior	++	++	++
	Cylinder velocity from 0.01 m/sec to 0.5 m/sec ³⁾	++	++	++
	Cylinder velocity > 0.5 m/sec to max. 0.8 m/sec ³⁾	-	++	++
	Stroke > 1.0 m	+/-	++	++
	Standstill period (wear)	++	++	++
	Undissolved air in the oil ⁴⁾	-	+	+

++ = very good

+ = good

+/- = conditional, depending on the application parameters

- = unsuitable

General technical data in corresponding data sheets will remain valid!

- 1) Moreover, observe the corresponding medium temperature range
- 2) Lower temperature limit -15 °C
- 3) Standard line connections not designed for that velocity
- 4) - seal is destroyed / + seal is not directly destroyed, leaks may occur

Generally, a medium temperature of approx. 40 °C is recommended. The specified values are to be regarded as guidelines; depending on the application, it may be necessary to check the suitability of the seal system.
